Where does solar energy come from?

Solar energy originates at the sun's core, where it is generated by nuclear fusion, a process by which two light atomic nuclei collide to form a heavier one while releasing energy. In this instance, a process known as a PP (proton-proton) chain reaction unfolds in which protons of hydrogen atoms aggressively collide.

What is solar energy?

Solar energy is the radiation from the Sun capable of producing heat, causing chemical reactions, or generating electricity. The total amount of solar energy received on Earth is vastly more than the world's current and anticipated energy requirements. If suitably harnessed, solar energy has the potential to satisfy all future energy needs.

How does solar energy work?

Solar energy is constantly flowing away from the sun and throughout the solar system. Solar energy warms Earth, causes wind and weather, and sustains plant and animal life. The energy, heat, and light from the sun flow away in the form of electromagnetic radiation (EMR).

How does the sun heat the Earth?

Most heat from the sun reaches Earth as infrared energy. Crammed between IR and UV is the visible light, which consists of all the colors visible on Earth. Solar energy flows away from the sun and travels throughout the solar system. It warms our planet and is responsible for its wind and weather.

How do solar panels turn sunlight into electricity?

There are several ways to turn sunlight into usable energy, but almost all solar energy today comes from “solar photovoltaics (PV).” Solar PV relies on a natural property of “semiconductor” materials like silicon, which can absorb the energy from sunlight and turn it into electric current.

How is solar energy converted into usable energy?

Solar energy is converted into usable energy through various high-powered and yielding solar technologies. When it reaches Earth, sun radiation can be harnessed by directly converting it into electricity using Photovoltaic cells (PV) or by converting it into heat using solar power thermals.
