Where are wind turbines best suited?

Wind turbines are best suited to elevated and open sites in rural and coastal areas. It is for this reason that one finds many domestic and industrial wind turbine installations in Scotland, Ireland and Cornwall. Assessing your local wind speed is the first step to take when making a decision on purchasing wind turbines.

Where should wind power be generated?

The study identified the American mid-west, Australia, Argentina, Central Asia and South Africa as the most ideal locations for generating wind power. The combination of both high power density and low seasonal variation in wind power make these locations well placed for future wind power development.

Where should wind turbines be located?

Wind power plant owners carefully plan where to position wind turbines and consider how fast and how often the wind blows at the site. Good places for wind turbines are where the annual average wind speed is at least 9 miles per hour (mph)—or 4.0 meters per second (m/s)—for small wind turbines and 13 mph (5.8 m/s) for utility-scale turbines.

What makes a good place for wind power development?

The combination of both high power density and low seasonal variation in wind power make these locations well placed for future wind power development. Areas that combine low seasonal variability and high mean power generation have a significant advantage for wind power over those that only place highly in one of the two factors.

How many areas are suitable for wind turbines?

We already have found ~30 000 new areas around the world that are well suited for Wind Turbines. Contact us if you need more details or you have

questions about the project.

How do you operate a wind power plant?

Operating a wind power plant is more complex than simply erecting wind turbines in a windy area. Wind power plant owners carefully plan where to position wind turbines and consider how fast and how often the wind blows at the site.
