Overview

Today, wind power is generated almost completely with wind turbines, generally grouped into wind farms and connected to the electrical grid. In 2022, wind supplied over 2,304 TWh of electricity, which was 7.8% of world electricity. [1] .

Wind power is the use of energy to generate useful work. Historically, wind power was used by , and , but today it is mostly used to generate electricity. This article deals only with wind power for.

A wind farm is a group of in the same location. A large wind farm may consist of several hundred individual wind turbines distributed over an extended area. The land between the turbines may be used for agricultural or other purposes. A wind farm may also be.

Growth trendsIn 2020, wind supplied almost 1600 of electricity, which was over 5% of worldwide electrical generation and about 2% of energy consumption. With over 100 added during 2020, mostly , global installed wind.

Small-scale wind power is the name given to wind generation systems with the capacity to produce up to 50 kW of electrical power. Isolated communities, that may otherwise rely on generators, may use wind turbines as an alternative. Individuals.

Wind is air movement in the Earth's atmosphere. In a unit of time, say 1 second, the volume of air that had passed an area A is $A v$. If the air density is ρ , the mass of this volume of air is .

Onshore wind is an inexpensive source of electric power, cheaper than coal plants and new gas plants. According to , wind turbines reached (the point at which the cost of wind power matches traditional sources) in some areas of Europe in.

The from wind power is minor when compared to that of . Wind turbines have some of the lowest : far less than.
