

Wind turbine generator power generation principle diagram

Overview

How does a wind turbine generate electricity?

As the wind blows, a wind turbine converts the kinetic energy of the wind's motion into mechanical energy by the rotation of the rotor, and this mechanical energy is transmitted by the shaft to the generator through the gear train. The generator converts this mechanical energy into electrical energy, thereby generating electricity.

What is the difference between upwind and downwind turbines?

Upwind turbines—like the one shown here—face into the wind while downwind turbines face away. Most utility-scale land-based wind turbines are upwind turbines. The wind vane measures wind direction and communicates with the yaw drive to orient the turbine properly with respect to the wind.

What is a wind power plant?

Wind energy is a natural form of energy that is capable of producing electrical or mechanical forces. Windmills or wind turbines are devices that are capable of converting the kinetic energy of wind into mechanical energy. This mechanical energy is further converted into electrical energy. Now let's discuss the importance of a wind power plant.

How does a geared wind turbine work?

In a geared wind turbine, the generator speed increases with the gear ratio so that the reduction in machine weight is offset by the gain in gearbox weight. For instance, the wind turbine operates at a speed of 15 rpm and the generator is designed to operate 1200 rpm (for 60 Hz) .

How does a utility-scale wind plant work?

In a utility-scale wind plant, each turbine generates electricity which runs to a substation where it then transfers to the grid where it powers our communities. Transmission lines carry electricity at high voltages over long

distances from wind turbines and other energy generators to areas where that energy is needed.

How does a windmill generator work?

The generator comes in various sizes with respect to the output. This generator converts mechanical energy into electrical power. The output of the generator is coupled to the load or system grid. This is the heavy structure set up with a proper foundation and carries all the components of the windmill.
