

World power systems

Overview

How can we create a sustainable global power system?

Replacing fossil fuels with renewables like wind and solar, providing energy access worldwide, modernizing grid systems and improving energy efficiency, among other actions, are critical for creating an equitable and sustainable global power system — one where people, nature and the climate can thrive.

Why should we change our power system?

Our current global power system accounts for 23% of global greenhouse gas emissions per year. Together, coal and gas made up more than 90% of emissions from electricity in 2019. Not only will it be necessary to change the existing system, but we also must bring modern, clean electricity to the 733 million people who lack access.

What percentage of the world's population does not have electricity?

However, 11% of the global population still lacks access to a reliable electricity supply, with lower income countries disproportionately represented. Burundi, for instance, still has over 90% of the population without electricity access.
