Overview

What is a microgrid in China?

In 2004, China began to carry out research on the concept of microgrids as proposed by the United States. This research has been based on the connection of distributed generation to large electrical grids via AC (alternating current) microgrids and the impacts of microgrids on large grids.

What is a microgrid system?

The term “microgrid” refers to a small power generation and distribution system composed of distributed generators, energy storage devices, energy conversion devices, related loads, monitoring devices and protective devices. It is an autonomous system that can realize self-control, protection and management.

What is the research on DC microgrids in China?

From 2009 to 2016, research on DC microgrids in China has gradually involved many different aspects, such as the study of DC microgrid power electronic converters, DC circuit breakers, and other key equipment, as well as operation control technology, protection, and energy management. 1.2 China’s Current and Planned Policies Regarding MG.

What is the future development direction of microgrids in China?

The future development direction of microgrids in China will therefore be towards an energy system that integrates electricity, gas, water, and heat resources, achieves mutual coupling, and solves the problems of efficient energy utilization and peak regulation .

What are the different types of microgrid projects in China?

In China, the microgrid projects that have been completed can be divided into island microgrids, remote areas microgrids, and urban area microgrids based on their geographic locations.

When did Tsinghua University start a microgrid project?

In September 2005, Tsinghua University signed a cooperative research agreement with Liaoning High Tech Energy Group Co., Ltd., establishing China's first microgrid Research Institute. In 2006, Tsinghua University worked with the State Key Laboratory of Power Generation Equipment Control and Simulation to build a microgrid experimental platform.
