Is double fed induction generator suitable for grid-connected wind energy conversion system?

This paper presents the control strategies and performance analysis of doubly fed induction generator (DFIG) for grid-connected wind energy conversion system (WECS). The wind power produces environmentally sustainable electricity and helps to meet national energy demand as the amounts of non-renewable resources are declining.

What is a doubly-fed generator?

The doubly-fed concept has ability to feed reactive power to support the grid and satisfy basic grid code requirements. The proven ABB doubly-fed generators has been designed to fit most turbines used today. The standard modular structure - with both air or water cooling - can be modified for different turbine interface connections.

What are doubly-fed induction generators (DFIGs)?

Among the VSGs, the doubly-fed induction generators (DFIGs) have been widely applied for wind farms (WFs) applications because of their advantages such as variable speed constant frequency operating capability and active/reactive power controllability.

What is reactive power management for DFIG based wind generators?

Reactive power management for DFIG based wind generators is also presented in a huge number of studies, commonly they studied on reactive power regulation together with active power , , , and some of them focused on the capability of doubly fed induction generators in providing reactive power , , .

Are DFIG based wind generators grid-connected?

There are numerous papers, which have focused on doubly fed induction

generators' operation as grid-connected systems. In , a comparative analysis has been presented on islanded and grid-connected operation of DFIG based wind generator, where it has been utilized in combination with other reservoir and generator systems.

What is advanced control of doubly fed induction generator?

Filled with illustrations, problems, models, analyses, case studies, selected simulation and experimental results, *Advanced Control of Doubly Fed Induction Generator for Wind Power Systems* provides the basic concepts for modelling and controlling of Doubly Fed Induction Generator (DFIG) wind power systems and their power converters.
